Doctor Web

Doctor Web develops and distributes Dr.Web information security solutions which provide efficient protection from malicious software and spam.

Doctor Web customers can be found among home users from all over the world and in government enterprises, small companies and nationwide corporations.

Dr.Web antivirus solutions are well known since 1992 for continuing excellence in malware detection and compliance with international information security standards.

State certificates and awards received by the Dr.Web solutions, as well as the globally widespread use of our products are the best evidence of exceptional trust to the company products.

We thank all our customers for their support and devotion to the Dr.Web products!

2. Dr.Web CureIt!

Dr.Web CureIt! is an anti-virus scanner based on Dr.Web Scanning Engine, the standard virus scanning engine of Dr.Web products. Although Dr.Web CureIt! has limited performance capabilities in comparison with Dr.Web Anti-virus for Windows (no resident monitor, no command line scanner, no updating utility, etc.), it is nevertheless able to effectively scan the system and perform necessary actions for detected threats.

You can use Dr.Web CureIt! free of charge to scan your personal computer. For any commercial use of Dr.Web CureIt!, however, a license is required. For details on licensing and purchasing the product, visit the Dr.Web CureIt! official website.

Dr.Web CureIt! detects and neutralizes the following types of malicious programs:

- Worms
- Viruses
- Trojans
- Rootkits
- Spyware
- Dialers
- Adware
- Hacktools
- Jokes
- Riskware

Dr.Web CureIt! is the ideal solution for situations when installation of an anti-virus is impossible due to virus activity or some other reason, because it does not require installation, operates under Windows® and Windows Server® operating systems for 32 or 64-bit platforms (from Microsoft Windows XP up to Microsoft Windows 10) and is constantly supplemented with the latest Dr.Web virus databases to ensure its effectiveness against all virus threats and other malicious programs. It also automatically detects the language used by your operating system. If your language is not supported, then Dr.Web CureIt! will use English by default.

Dr.Web CureIt! sends general information on your computer and its state of information security to Doctor Web. When using Dr.Web CureIt! Commercial Edition, statistics gathering is optional.

⚠️ To use Dr.Web CureIt! Free Edition, you must run the program under an account with administrative privileges and have connection to the Internet.
2.1. System Requirements

To use Dr.Web CureIt!, your computer should meet the following requirements:

<table>
<thead>
<tr>
<th>Specification</th>
<th>Requirement</th>
</tr>
</thead>
</table>
| OS            | For 32-bit platforms:  
|               | - Windows XP with Service Pack 3 or higher  
|               | - Windows Vista with Service Pack 2 or higher  
|               | - Windows 7  
|               | - Windows 8  
|               | - Windows 8.1  
|               | - Windows 10  
|               | - Windows Server 2003 with Service Pack 1  
|               | - Windows Server 2008 with Service Pack 2 or higher  
|               | For 64-bit platforms:  
|               | - Windows Vista with Service Pack 2 or higher  
|               | - Windows 7  
|               | - Windows 8  
|               | - Windows 8.1  
|               | - Windows 10  
|               | - Windows Server 2008 with Service Pack 2 or higher  
|               | - Windows Server 2008 R2  
|               | - Windows Server 2012  
|               | - Windows Server 2012 R2  
|               | - Windows Server 2016  
| Hard disk space | 160 MB of disk space |
| Free RAM      | Minimum 360 MB of RAM |
| CPU           | With an i686-compatible processor and SSE2 instructions. |

2.2. Testing Your Anti-Virus

The EICAR (European Institute for Computer Anti-Virus Research) test file can help you test the performance of those anti-virus programs that detect viruses using signatures.

For this purpose, most of anti-virus software vendors generally use a standard test.com program. This program was designed specifically so that users could test how a newly-installed anti-virus tool reacts when it detects a virus—without compromising the security of their
computers. Although the test.com program is not actually a virus, it is treated by the majority of anti-viruses as if it were a virus. On detection of this "virus", Dr.Web CureIt! reports the following: EICAR Test File (Not a Virus!). Other anti-virus tools alert users in a similar way.

The test.com program is a 68-byte COM-file that prints the following line on the console when executed: EICAR-STANDARD-ANTIVIRUS-TEST-FILE!

The test.com file contains the following character string only:

```
X5O!P%@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*
```

To get your own test file with the "virus", create a new text file with this line and save it as test.com.

**2.3. Detection Methods**

The Doctor Web anti-virus solutions simultaneously use several methods to detect malicious software, and that allows them to perform thorough checks on suspicious files and to control software behavior.

**Detection Methods**

**Signature analysis**

The scans begin with signature analysis which is performed by comparing segments of code in a scanned file to known virus signatures. Signature is a finite continuous sequence of bytes which is necessary and sufficient to identify a specific virus. To reduce the size of the signature dictionary, the Dr.Web anti-virus solutions use signature checksums instead of complete signature sequences. Checksums uniquely identify signatures, which preserves correctness of virus detection and neutralization. The Dr.Web virus databases are composed so that some entries can be used to detect not just specific viruses, but whole classes of threats.

**Origins Tracing**

On completion of signature analysis, Dr.Web uses the unique Origins Tracing method to detect new and modified viruses which use the known infection mechanisms. Thus, Dr.Web users are protected against such threats as notorious blackmailer Trojan.Encoder.18 (also known as gpcode). In addition to detection of new and modified viruses, the Origins Tracing mechanism allows to considerably reduce the number of false triggering of the heuristics analyzer. Objects detected using the Origins Tracing algorithm are indicated with the .Origin extension added to their names.
**Execution emulation**

The technology of program code emulation is used for detection of polymorphic and encrypted viruses, when the search against checksums cannot be applied directly, or is very difficult to perform (due to the impossibility of building secure signatures). The method implies simulating the execution of an analyzed code by an *emulator*—a programming model of the processor and runtime environment. The emulator operates with a protected memory area (*emulation buffer*), in which execution of the analyzed program is modeled instruction by instruction. However, none of these instructions is actually executed by the CPU. When the emulator receives a file infected with a polymorphic virus, the result of the emulation is a decrypted virus body, which is then easily determined by searching against signature checksums.

**Heuristic analysis**

The detection method used by the heuristics analyzer is based on certain knowledge (*heuristics*) about certain features (attributes) that might be typical for the virus code itself, and vice versa, that are extremely rare in viruses. Each attribute has a weight coefficient which determines the level of its severity and reliability. The weight coefficient can be positive if the corresponding attribute is indicative of a malicious code or negative if the attribute is uncharacteristic of a computer threat. Depending on the sum weight of a file, the heuristics analyzer calculates the probability of unknown virus infection. If the threshold is exceeded, the heuristic analyzer generates the conclusion that the analyzed object is probably infected with an unknown virus.

The heuristics analyzer also uses the FLY-CODE technology, which is a versatile algorithm for extracting files. The technology allows making heuristic assumptions about the presence of malicious objects in files compressed not only by the packagers Dr.Web is aware of, but by also new, previously unexplored programs. While checking packed objects, Dr.Web anti-virus solutions also use structural entropy analysis. The technology detects threats by the characteristic way in which pieces of code are arranged inside a file; thus, one database entry allows identification of a substantial portion of threats packed with the same polymorphous packager.

Like any system designed to check hypotheses under uncertainty, the heuristics analyzer may commit type I or type II errors (omit viruses or raise false alarms). Thus, objects detected by the heuristics analyzer are treated as "suspicious".

While performing any of the above-mentioned checks, the Dr.Web anti-virus solutions use the most recent information about known malicious software. As soon as experts of Doctor Web anti-virus laboratory discover new threats, the update for virus signatures, behavior characteristics and attributes is issued. In some cases updates can be issued several times per hour.
2.4. Sending Statistics

In order to provide analysis of information security threats and an overall viral situation around the globe as well as to ensure continuous development and improvement of Dr.Web products, Dr.Web CureIt! sends anonymous statistics while it scans and cures your system. This data contain only the following general information:

- CPU details including processor name, technical description, current and maximum speed, number of processor cores, and number of logical processors.
- RAM details including amount of physical and virtual memory both total and available at the time of scanning.
- Operating system parameters including its name, version, build number, installed service packs, operation mode, type of account (user or administrative), and locale settings.
- Information on installed anti-virus, anti-spy, and firewall software.
- Information on each detected threat including its name and type, the name and type of infected object, the action applied to it, and the hash of the infected file when necessary.
- Scan summary including scanning time, number of scanned files and objects, number of suspicious objects, and number of detected threats per type.
- Summary on applied actions including the number of unmodified objects as well as the number of cured, deleted, moved, renamed, and ignored objects.

The Doctor Web privacy policy is available on the official website at https://company.drweb.com/policy.
3. Quick Start

Dr.Web CureIt! allows you to run anti-virus scans of boot sectors, random access memory (RAM) and both separate files and objects enclosed within complex objects (archives, e-mail attachments, installation packages). Dr.Web CureIt! uses all detection methods to find viruses and other malicious software.

⚠️ Scanning of emails is not allowed by the license agreement of Dr.Web CureIt! Free Edition.

Dr.Web CureIt! does not check archived files by default. You can enable scanning of archived files in Dr.Web CureIt! settings.

Dr.Web CureIt! just informs you when a malicious object is found. Information on all infected or suspicious objects is displayed in a table where you can manually select a necessary action. You can either apply default actions to all the detected threats or you can manually select a necessary action for individual objects.

The default settings are optimal for most cases. However, if necessary, you can choose which actions are suggested upon threat detection by using Dr.Web CureIt! settings. Please note that you can set a custom action for each detected threat after a scan is completed, but a common reaction for a particular threat type should be configured before you start a scan.

⚠️ Dr.Web CureIt! sends general information on your computer and its state of information security to Doctor Web. When using Dr.Web CureIt! Commercial Edition, statistics gathering is optional.

Display language

To change the display language, click the Language icon on the toolbar, and then select the necessary option.

3.1. Dr.Web CureIt! Update

Dr.Web CureIt! does not include an updating module, therefore it remains fully efficient only until the next database update (which occurs approximately every hour). After that, to ensure the ultimate anti-virus operation efficiency, the latest version of Dr.Web CureIt! should be downloaded again. The latest Dr.Web CureIt! version is always available for download from the Dr.Web CureIt! official website. Once you download the program, it acts as a very effective scanner with the latest databases and the most advanced virus detection engine.

To download the latest Dr.Web CureIt!

1. Run Dr.Web CureIt!. 
2. When an update is necessary, the first window License and updates displays a notification. To update Dr.Web CureIt!, click update the program in the notification area. This opens the Dr.Web CureIt! official website with the default Internet browser, where you can download the latest version of the Dr.Web CureIt!.

3.2. Express Scan

Dr.Web CureIt! provides a pre-installed template for anti-virus scanning of the most vulnerable objects of your operating system.

In this mode the following objects are scanned:

- Random access memory
- Boot sectors of all disks
- Root folder on boot disks
- Root folder on the disk on which Windows is installed
- Windows system folder
- My documents folder
- System temporary files
- User temporary files
- Rootkits presence

If a more flexible configuration of an anti-virus scanning is required, you can perform a custom scan.
To run express scans

1. Run Dr.Web CureIt!.
2. In the **License and updates** window, read the conditions of statistics gathering. Click **Continue**.
3. In the scan type selection window, click **Start scanning**.

4. During scanning, Dr.Web CureIt! displays general information on its progress and lists detected threats.

   To manage the scanning process, use the following options:
   - To suspend scanning, click **Pause**.
   - To continue with the scanning, click **Resume**.
   - To terminate scanning, click **Stop**.

   The **Pause** button is not available while processes and RAM are being scanned.
5. Once scanning is complete, Dr.Web CureIt! displays detailed information on detected threats. Review the scan results. If necessary, you can also review the scanning log by clicking Open report.

6. If scanning reveals viruses or other threats, you need to secure your system by neutralizing them. To apply predefined actions to all detected threats at once, click Neutralize. If necessary, you can select custom actions for particular threats.

3.3. Quarantine Manager

The Quarantine component of Dr.Web CureIt! serves for isolation of files that are suspected to be malicious. Quarantine also stores backup copies of files processed by Dr.Web CureIt!. 
Quarantine is stored in folder `%USERPROFILE%\Doctor Web\DrWeb CureIt Quarantine`. Infected objects are moved to the corresponding subfolder, and then, unless the quarantine folder is located on a removable drive, these quarantined objects are encrypted.

To open Quarantine Manager, in the Dr.Web CureIt! window, click Preferences in the toolbar, and select Quarantine Manager.

The central table lists the following information on quarantined objects:

- **Object**—name of the quarantined object.
- **Threat**—malware class of the object, which is assigned by Dr.Web CureIt! when the object is quarantined.
- **Date added**—the date and time when the object was moved to quarantine.
- **Path**—full path to the object before it was quarantined.

Files in the Quarantine window are displayed for those users only, who have access to them. To view hidden objects, run Dr.Web CureIt! under an administrative account.

The Quarantine window provides following buttons:

- **Restore**—Remove the selected objects from the quarantine and restores them to their original location (the folder where the object has resided before it was moved to the quarantine).
- **Restore to**—Remove the selected objects from the quarantine and restores them to selected location.
Use this option only when you are sure that the selected objects are not harmful.

- **Delete**—Delete the selected objects from the quarantine and from the system.

Select checkbox for the object names and then choose a required action to apply the changes simultaneously to multiple files.
4. Advanced Options

For most cases, express scanning is enough to cure your computer from infections and malicious programs. In rare cases when subtle tuning is necessary, use the following options:

- Perform custom scan, which allows you to select particular operating system objects or files and folders to scan.
- Select custom actions to apply to detected threats.
- Configure general settings of anti-virus scanning.
- Run Dr.Web CureIt! with command line parameters.

4.1. Custom Scan

Apart from the pre-installed scanning template that helps running an express scan of the most vulnerable objects of the operating system, Dr.Web CureIt! also provides you with custom scan mode that allows you to configure scanning in accordance with your particular needs.

This mode allows you to select objects for scanning: any folders and files, and such objects as random access memory, boot sectors, etc. Click Start scanning to scan selected objects. In case you perform a full or express scan, you do not need to select any objects.

You can select a scan type in the Scan mode window with every new launch of Dr.Web CureIt!.

Custom scan

1. Run Dr.Web CureIt!.
2. In the **License and updates** window, read the conditions of **statistics gathering**. Click **Continue**.

3. In the scan type selection window, click **Select objects for scanning**.

4. The table in the center of this window lists objects for scanning. You can add files and folders to check for viruses. For this, click the link at the bottom of the table, and then select objects for scanning in the **Browse** window.

   To select all the objects in the table, select the **Scanning objects** checkbox in the table heading.

![Image of Dr.Web CureIt! interface](www.drweb.com)

5. If necessary, configure Dr.Web CureIt! settings before starting the scan. To do this, click **Preferences** on the toolbar.

6. Click **Start scanning**.

7. During scanning, Dr.Web CureIt! displays general information on its progress and lists detected threats.

   To manage the scanning process, use the following options:
   - To suspend scanning, click **Pause**.
   - To continue with the scanning, click **Resume**.
   - To terminate scanning, click **Stop**.

   **Warning**: The **Pause** button is not available while processes and RAM are being scanned.
8. Once scanning is complete, Dr.Web CureIt! displays detailed information on detected threats. Review the scan results. If necessary, you can also review the scanning log by clicking Open report.

9. If scanning reveals viruses or other threats, you need to secure your system by neutralizing them. To apply predefined actions to all detected threats at once, click Neutralize. If necessary, you can select custom actions for particular threats.

4.2. Configuring Threat Neutralization

By default, if known viruses or computer threats of other types are detected during scanning, Dr.Web CureIt! just informs you about them. You can neutralize all detected threats at once by
clicking **Neutralize**. In this case Dr.Web CureIt! applies the most effective actions set by default in accordance with its configuration and threat type.

By clicking **Neutralize** you apply actions to the objects selected in the table (as indicated by check marks). Dr.Web CureIt! selects all objects by default once scanning completes. When necessary, you can customize selection by using checkboxes next to object names or threat categories from the drop-down menu in the table header.

![Dr.Web CureIt! interface](image)

You can also apply actions separately or change default action for particular threats. Threats to your security can be neutralized either by restoring the original state of each infected object (**curing**), or, when curing is impossible, by removing the infected object completely from your operating system (**deleting**).

**To select an action**

1. In the **Action** field from the drop-down list, select a necessary action for each object. By default, Dr.Web CureIt! suggest the most effective actions.
2. Click **Neutralize**. Dr.Web CureIt! applies the selected actions to all threats.

Suspicious objects are moved to the quarantine folder and should be sent for analysis to the Doctor Web anti-virus laboratory.

There are some limitations:

- For suspicious objects curing is impossible.
- For objects which are not files (e.g. boot sectors) moving and deleting are impossible.
- For files inside archives, packages or attachments, any actions are impossible. You can apply an action to a whole object only.
The detailed report on Dr.Web CureIt! activity is saved in the `CureIt.log` file that is located in the folder `%USERPROFILE%\Doctor Web`.

### 4.3. Configuring Scanning

The default settings are optimal for most uses. Do not change them unnecessarily.

**To configure Dr.Web CureIt!**

1. If Dr.Web CureIt! is not running, start the program. This opens the Dr.Web CureIt! window.
2. Click the **Preferences** icon on the toolbar, and then select **Settings**. This opens a window that contains the following tabs:
   - **Main** tab where you can configure general parameters of Dr.Web CureIt! operation.
   - **Actions** tab where you can configure the reaction of Dr.Web CureIt! to the detection of infected or suspicious files and archives or other malicious objects.
   - **Exclusions** tab where you can specify files and folders to be excluded from scanning.
   - **Log** tab where you can set logging options for Dr.Web CureIt!
3. To get information on options in the tab, click **Help ?**.
4. After editing, click **OK** to save the changes or **Cancel** to cancel them.

Changes in the settings of Dr.Web CureIt! are retained only in the current program session. New session resets program settings to default values.

#### 4.3.1. Main Tab

On this tab you can set general parameters of Dr.Web CureIt! operation.
You can enable sound notifications on particular events, set Dr.Web CureIt! to apply recommended actions to detected threats automatically, and configure Dr.Web CureIt! interaction with the operating system.

On this page, you can also specify self-protection parameters and disable miscellaneous operations that may compromise security of your computer.

### 4.3.2. Actions Tab

Once scanning is complete, Dr.Web CureIt! just informs you on detection of a malicious object and prompts to neutralize threats by applying suitable actions. These actions are suggested in accordance with the settings on this tab.

The best action for curable threats (e.g. files infected with known viruses) is curing, since it allows to restore the infected file completely. It is recommended to move other types of threats to quarantine for further analysis in order to prevent loss of potentially valuable data.

You can select one of the following actions:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cure</td>
<td>Instructs Dr.Web CureIt! to try to restore the original state of an object before infection. If the object is incurable, or the attempt of curing fails, the action set for incurable viruses is applied. Available for known viruses only except Trojan programs and files within complex objects (archives, email attachments, file containers). Trojan programs are deleted on detection.</td>
</tr>
</tbody>
</table>

![Settings window](image)
## Action | Description
--- | ---
Cure | Cure is the only action available for infected boot sectors.
Move to quarantine | Instructs Dr.Web CureIt! to move the object to a specific quarantine folder. By default, the quarantined files are located in the `%USERPROFILE%\Doctor Web\DrWeb CureIt Quarantine\` hidden folder that becomes accessible once scanning is complete. No action is performed on malicious objects for which you selected this action, if they are detected in a boot sector.
Delete | Instructs Dr.Web CureIt! to delete the object. No action is performed on malicious objects for which you selected this action, if they are detected in a boot sector.
Ignore | Instructs Dr.Web CureIt! to skip the object without performing any action or displaying a notification. Available for potentially dangerous files only which includes adware, dialers, jokes, hacktools and riskware.

⚠️ Threats detected within complex objects (archives, email attachments, file containers) cannot be processed individually. By default, all such objects are moved to quarantine.

To cure some infected files, it is necessary to reboot Windows. You can choose one of the following:

- **Prompt restart.**
- **Restart computer automatically.** It can lead to loss of unsaved data.

### 4.3.3. Exclusions Tab

On this tab, you can specify files and folders that should be excluded from scanning and determine whether to scan contents of archives and installation packages.

Scanning of emails is not allowed by the license agreement of Dr.Web CureIt! (Free Edition). Use Dr.Web CureIt! (Commercial Edition) or other Dr.Web products to check contents of email files.
Excluded files list

Here you can list all files (file masks) that are excluded from scanning (i.e. the action is applied to all files with the same name). This option is appropriate for temporary files, swap files, etc.

To configure excluded files list

Do one of the following:

- Add name or mask of the file that should be excluded from scanning. If file already exists, click **Browse** and select the file. You can also use masks.

  A mask denotes the common part of object names:
  
  - The '*' character replaces any, possibly empty, sequence of characters.
  - The '?' character replaces any one character.
  - Other mask characters do not replace anything and mean that the name must contain this particular character in this place.

  Examples:
  
  - **Report*.doc** defines all Microsoft Word documents the names of which start with the word "Report" (ReportFebruary.doc, Report121209.doc, etc.).
  - ***.exe** defines all executable files with the EXE extension (setup.exe, iTunes.exe, etc.).
  - **photo????09.jpg** defines all JPG images the names of which start with the word "photo", end with "09" and contain exact number of 4 other characters in the middle (photo121209.jpg, photoJude09.jpg, photo----09.jpg, etc.).
• Click **Add**, and the file or its mask will be added to the list below.

• To remove a file from the list, select it and click **Delete**. The file will be checked on the next scan.

### 4.3.4. Log Tab

On the Log tab, you can set up the parameters of the log file.

The Dr.Web CureIt! log is stored in the *CureIt.log* file that is located in folder `%USERPROFILE%\Doctor Web*. It is recommended to analyze the log file from time to time.

You can set one of the following modes for the log file:

• **Standard**—logs only the most important events (time Dr.Web CureIt! starts and stops, detected threats).

• **Debugging**—logs maximum data about Dr.Web CureIt! activity. This may result in considerable growth of the log file. It is recommended to use this mode only when errors occur or by request of Doctor Web technical support.

### 4.4. Launching From Command Line

You can run Dr.Web CureIt! in the command line mode which allows you to specify settings of the current scanning session and the list of objects for scanning as additional parameters.

To use the command line interface in the Free Edition of Dr.Web CureIt!, you are required to confirm that you agree to the automatic sending of anonymous statistics to Doctor Web.
When using the Commercial Edition of Dr.Web CureIt!, you don’t need to give such a consent.

The launching command syntax is as follows:

```
[<path_to_program>] [<CureIt!_file_name>] [<objects>] [<switches>]
```

The list of objects to be scanned can be left empty or contain several paths separated by whitespaces. If no path to the objects is specified, Dr.Web CureIt! searches for the objects in the Dr.Web CureIt! folder.

The most commonly used examples of specifying the objects for scanning are given below:

- `/LITE`—perform a basic scan of random access memory and boot sectors of all disks. This mode also is able to detect rootkits.
- `/FAST`—perform an express scan of the system.
- `/FULL`—perform a full scan of all hard drives and removable media (including boot sectors).

Switches are command line parameters that specify program settings. If no switches are defined, scanning is performed with the settings specified earlier (or with the default settings if you have not changed them). Each switch begins with the forward slash character `/` and is separated with a whitespace from other switches. If a parameter contains a whitespace, you have to put quotation marks around this parameter. For example:

- `636frs47.exe /tm-
- 45hlke49.exe /tm- D:\test\`
- `10sfr56g.exe /OK- "D:\Program Files\"

The most commonly used examples of specifying the objects for scanning are given below:

- `*`—scan all files on all disks
- `C:`—scan all files on disk C
- `D:\Games`—scan all files in the specified folder
- `C:\games\*`—scan all files and subfolders in the specified folder

### 4.4.1. Command Line Switches

- `/AA`—apply actions to detected threats automatically.
- `/AR`—check archives. Option is disabled by default.

⚠️ To enable the feature, you have to specify the `/AR` parameter explicitly.

To check files in archives when running a scan from GUI, select the **Archives** checkbox on the **Exclusions** tab of the Dr.Web CureIt! settings.

- `/AC`—check installation packages. Option is disabled by default.
To enable the feature, you have to specify the `/AC` parameter explicitly.

To check files in installation packages when running a scan from GUI, select the **Installation packages** checkbox on the **Exclusions** tab of the Dr.Web CureIt! settings.

/AFS—use forward slash to specify paths to contents within an archive. Option is disabled by default.

/ARC:<number>—maximum archive object compression. If the compression rate of the archive exceed the limit, scanner neither unpacks, nor scans the archive. Unlimited by default.

/ARL:<number>—maximum archive nesting level. Unlimited by default.

/ARS:<number>—maximum archive size (in KB). If the size of an archive exceeds the limit, Dr.Web CureIt! neither unpacks, nor scans the archive. Unlimited by default.

/ART:<number>—minimum size of a file inside an archive beginning from which compression ratio check will be performed (in KB). Unlimited by default.

/ARX:<number>—maximum size of objects in archives that should be checked (in KB). Unlimited by default.

/BI—show information about Dr.Web virus databases. Option is enabled by default.

/DR—scan folders recursively (i.e., scan subfolders). Option is enabled by default.

/E:<number>—use the specified number of Dr.Web Engines.

/FAST—perform an express scan of the system.

/FL:<file_name>—scan paths listed in the specified file.

/FM:<mask>—scan files matching the specified mask. By default, all files are scanned.

/FR:<regexpr>—scan files matching the specified regular expression. By default all files are scanned.

/FULL—perform a full scan of all hard drives and removable media (including boot sectors).

/HA—use heuristic analysis to detect unknown threats. Option is enabled by default.

/LITE—perform a basic scan of random access memory and boot sectors of all disks as well as a check on rootkits. This parameter disables the /FAST and /FULL modes.

/LN—resolve shell links. Option is disabled by default.

/MC:<number>—set the maximum number of cure attempts. Unlimited by default.

/NB—do not backup cured or deleted files. Option is disabled by default.

/NI[:X]—limits usage of system resources at scanning and priority of the scanning process. Unlimited by default.

/NOREBOOT—cancel system reboot and shut down after scanning.

/NT—check NTFS streams. Option is enabled by default.

/OK—display the full list of scanned objects showing OK for clean files. Option is disabled by default.

/P:<priority>—priority of the current scanning task in a queue:

0—the lowest
Advanced Options

/L—low
/N—general (used by default)
/H—the highest
/M—maximal

/PAL:<number>—maximum number of packer nesting levels (1000 by default).

/RA:<file_name>—append the specified file with the current scanning report. By default, report is not generated.

/RP:<file_name>—rewrite the specified file with the current scanning report. By default, report is not generated.

/QNA—double quote file names.

/QUIT—terminate Dr. Web CureIt! once scanning completes whether or not the detected threats are neutralized.

/REP—follow symbolic links while scanning. Option is disabled by default.

/SCC—show contents of complex objects (archives, email attachments, file containers). Option is disabled by default.

/SCN—show installation package name. Option is disabled by default.

/SPN—show packer name. Option is disabled by default.

/SST—display file scan time. Option is disabled by default.

/TB—check boot sectors including master boot record (MBR) of the hard drive. Option is disabled by default.

/TM—check processes in memory including Windows system control area. Option is disabled by default.

/TR—check system restore points. Option is disabled by default.

/W:<time>—maximum scan time in seconds. Unlimited by default.

/X:S[:R]—after scanning, shutdown, reboot, suspend, or hibernate the computer.

Configuring actions for threats

Use the following modifiers to select actions for different types of threats (C—cure, Q—move to quarantine, D—delete, I—ignore):

- /AAD:<action>—action for adware (possible actions: DQI).
- /AAR:<action>—action for infected archives (possible actions: DQI).
- /ACN:<action>—action for infected installation packages (possible actions: DQI).
- /ADL:<action>—action for dialers (possible actions: DQI).
- /AIN:<action>—action for infected files (possible actions: CDQ).
- /AJK:<action>—action for jokes (possible actions: DQI).
• /ARW:<action>—action for riskware (possible actions: DQI).
• /ASU:<action>—action for suspicious files (possible actions: DQI).

**Switch modifiers**

Several switches may have modifiers that clearly enable or disable options specified by these switches. For example:

/AC——explicitly disable scanning of installation packages.
/AC or /AC+—explicitly enable scanning of installation packages.

These modifiers can be useful when the necessary option is enabled or disabled by default.

The following parameters accept these modifiers:

/AR, /AC, /AFS, /BI, /DR, /HA, /LN, /NB, /NT, /OK, /QNA, /REP, /SCC, /SCN, /SPN, /SST, /TB, /TM, /TR.

For the /FL switch, the - modifier directs to scan paths listed in the specified file and then delete this file.

For the /ARC, /ARL, /ARS, /ART, /ARX, /NI[:X], /PAL, and /W switches, if 0 is specified as value for the <number> modifier, there is no limit for the switch.

If several alternative switches are found in the command line, the last of them takes effect.
